1 Introduction

The following report has been automatically generated. Its purpose is to provide illustrations of the effectiveness of Track Forever. In order to generate these results, several projects were selected from public issue trackers and imported into Track Forever. At this point, issues were manually evaluated according to the following rubric.

Test	Possible Points	Grading
Did the issue successfully import?	-	Pass/fail based on random sampling. If this fails, all other categories receive automatic zeroes. CSV script accepts 0 for missing, 1 for present.
Was important information preserved? <ul style="list-style-type: none">• Time submitted/updated• Labels, Status• Comment/Summary field contents• Hyperlinks, embedded objects	4	Partial credit available based on fraction of information preserved. See items listed to the left. One error in any category loses the whole point.
Was user information preserved? <ul style="list-style-type: none">• Submitter/commenter IDs• Assignee IDs	2	Partial credit, with 1 point for each bullet. One missing ID loses the whole point.
Are there any rendering errors on the webpage? <ul style="list-style-type: none">• No markdown/formatting errors• No missing character symbols• All elements resize properly	3	Partial credit, with 1 point for each bullet. One error in any category loses the whole point.
Are there any other pieces of information not preserved? <ul style="list-style-type: none">• Platform specific features• Other minor information	2	Remove 1 point for every type of information not preserved, up to 2 points.

This part must be done manually. Quality of the conversion is a measurement that only humans can make.

For each issue evaluated, the results from the rubric were written into a CSV file. An automated script then tabulated the results and generated this report.
